Implicant Algorithm

Heuristics for decomposition of Boolean System

Bivium cryptanalysis

Results

Results

Conclusions

Main Contributions

- ▶ Shows that the implicant based Boolean system solver [6] is effective in solving Boolean equations of Bivium in realistic conditions, time and memory and recover the key from an output stream.
- ▶ Shows that the symbolic model of Bivium output streams is computable in practically feasible time and memory.
- ▶ Discovered two heuristics for decomposing Boolean equations which are general enough to be useful for cryptanalysis of ciphers whose Boolean models are available offline.

Results

Results

Conclusions

Main Objectives of the research

- ▶ To establish the role and importance of *symbolic modelling* in Boolean cryptanalysis. *Boolean Cryptanalysis* is distinguished from algebraic cryptanalysis by its reliance on Boolean arithmetic computations rather than commutative algebraic arithmetic.
- ▶ To emphasise that Boolean cryptanalysis is the most definite general method of Cryptanalysis of lower complexity than brute force search over key space, is parallel and can be used for practical evaluation of security of cryptographic primitives.

Key Recovery Problem

- ▶ General model of a stream cipher as dynamic system is specified by a finite state map $F : \mathbb{F}_2^n \rightarrow \mathbb{F}_2^n$ and a function $f : \mathbb{F}_2^n \rightarrow \mathbb{F}_2$ giving a state output system

$$\begin{aligned}x(k+1) &= F(x(k)) \\w(k) &= f(x(k))\end{aligned}\tag{1}$$

where $x(k)$ is the internal state (of all the shift registers) and $w(k)$ is the output (key stream bit) of the cipher at an instant k .

- ▶ The symmetric key K and IV are part of initial condition $x(0)$.

Problem

Key recovery problem: Given an instant $k_0 > 0$, the IV of the stream cipher and the output stream

$w(k_0), w(k_0 + 1), \dots, w(k_0 + m)$ for some $m > 0$ find the key K .

Internal state recovery problem

Problem

Internal state recovery problem: Given an instant $k_0 > 0$ and an output stream $w(k)$ for $k = k_0, k_0 + 1, k_0 + 2, \dots, k_0 + m$ corresponding to an unknown key K and known IV, find the internal state $x(k_0)$.

Internal State Recovery attack:

- ▶ Compute all solutions $x(k_0)$ of the internal state from the output stream $w(k)$ for $k \geq k_0$.
- ▶ Invert $x(k_0)$ to $x(0)$ by inversion of the state map $F(\cdot)$.
- ▶ Identify correct $x(0)$ by matching IV. Recover K from $x(0)$.

Results

Results

Conclusions

Symbolic model computation

- ▶ Output stream:

$$w(k_0 + j) = f_j(x(k_0)) = f(F^{j-1}(x(k_0))) \quad (2)$$

Offline one time computation of functions in RHS of equation (2). This is the symbolic model of output equations.

- ▶ Solution of the Boolean system (2) leads to recovery of internal state $x(k_0)$. There might be several solutions $x(k_0)$.
- ▶ Symbolic inverse model $F^{-1}(\cdot) = G(\cdot)$ of the state map required for key recovery. Inverse state update symbolic system

$$x(k-1) = G(x(k))$$

Conclusions

Solving the Boolean System

- ▶ Boolean system given by symbolic model (2)

$$w(k_0 + j) = f_j(x(k_0))$$

- ▶ Hardest Computational problem: All solutions of Boolean satisfiability ($\#P$ complete)
- ▶ All satisfying assignments required: to get all solutions $x(k_0)$.

Implicant based Boolean system solver

[6] Virendra Sule. An implicant based parallel all solution solver for Boolean satisfiability. [arxiv.org/1611.09590v3](https://arxiv.org/abs/1611.09590v3). Feb 2017.

- ▶ Represents all satisfying assignments of a Boolean System as implicants. (compact representation without free variables).
- ▶ Computes a complete set of Orthogonal implicants of the system which gives all assignments as a disjoint (hence parallelly computable) union of sets.
- ▶ Other SAT algorithms solve the Decision Problem only.
- ▶ The algorithm is completely (thread) parallel.
- ▶ Does not require CNF form of the Boolean formula. (Conversion to CNF form for complex systems has computational overheads).

Implicant based Boolean system solver

- ▶ A term t is an *implicant* of a Boolean function $f(X)$ in variables $X = (x_1, \dots, x_n)$ if

$$t(x) \leq f(x) \quad (3)$$

for any assignment x of X .

- ▶ A *complete set of implicants* $I(f)$ of f is a set of implicants such that if $f(x) = 1$ for an assignment x then there exists at least one term t in $I(f)$ such that $t(x) = 1$.
- ▶ Complete implicant set of a product of two functions

$$\begin{aligned} fg: I(fg) &= \{ts, t \in I(f), s \in I(g/t)\} \\ fg: I(fg) &= \{ts, t \in I(f/s), s \in I(g)\} \end{aligned} \quad (4)$$

Conclusions

Implicant Algorithm

- ▶ Recursive implicant set generation for a product formula

$$F_m = f_1 f_2 \dots f_m = \prod_{i=1}^m f_i$$

- ▶ $F_m = f_1 F_{(m-1)}$, $F_{(m-k)} = f_{(k+1)} F_{(m-k-1)}$, $F_1 = f_m$.
- ▶ Using (4)

$$I(F_m) = \{ts, s \in I(F_{(m-1)}/t), t \in I(f_1)\}$$

Recursively the algorithm computes a complete implicant set of $F_{(m-1)}/t$

- ▶ Pivot factor f_1 can be chosen arbitrarily.
- ▶ Implicants of pivotes chosen Orthogonal leading to orthogonal implicants at each end of thread.

Heuristics for decomposition of Boolean System

- ▶ H1: Search over *top ranked* variables: variables which arise in largest number of functions as arguments. E.g. if x_1 is present in 10 functions f_i and x_2 is present in 11 functions, then x_2 has higher rank than x_1 .
- ▶ H2: Search over implicants of equations which have non-overlapping variables. The implicant set is the product of implicant sets of individual equations.
- ▶ Top ranked variables simplify the equations rapidly.
- ▶ Combination of the strategies H1, H2 may be more effective.

Case of Bivium equations

1. First set of 66 equations are linear with 4 variables each. All equations have mutually independent variables (non-overlapping variables in any pair of equations). Hence H2 possible on these equations.
2. 8 implicants in these 4 variables for each equation irrespective of the value of output w . Implicants of different equations have non-overlapping variables.
3. If m of these 66 equations are chosen the search space is $8^m = 2^{3m}$ independent strings of $4m$ variable assignments.

Results

Results

Conclusions

Conclusions

- ▶ Symbolic model of Bivium cipher is computationally simple and represented with low memory requirements.
- ▶ Boolean Cryptanalysis is successful in the case of Bivium in realistic conditions.
- ▶ Heuristic H1: Search by assigning top ranked variables. Fast but has higher memory requirement.
- ▶ Heuristic H2: constructing search based on equations with non-overlapping variables has lesser memory requirement but higher computational time requirement for the equations in the present case.
- ▶ Any cipher with symbolic model computed can be evaluated by the Boolean solver for cryptanalysis. This solver can thus be useful as a universal marker of strength of a cipher.
